How to handle these structures? Say I have a pointer to a structure: typedef struct A { int a; int b; } A; A *p; Now how to declare this structure so that it can be used as follows? (*p)->a // OK p->a // error: "expected expression" p.a // error: "expected expression" A: First of all, there's no such thing as typedef struct. What you have is (on top of that, only on top of that, which is quite irrelevant): struct A { int a; int b; }; When you write (*p).a this is just another name for p->a So to make the dot work, what you'd have to do is to define: typedef struct A { int a; int b; } A; or: typedef struct A { int *a; int b; } A; And if you now want to do: (*p).a you just have to write: (*p).a The same applies to p->a. a1d647c40b
