WMS Log Storage Professional Edition Crack 2022 [New]

WMS Log Storage Professional Edition is an effective, intuitive and affordable solution for recording your website visitors, file downloads and log file analysis of various Media Services. As a website administrator, you might have to deal with websites that are slow or don't load at all. Such sites can be due to one of the following reasons: bad hosting low server speed lack of website optimization In order to resolve this issue, you need to go through a step-by-step process. It starts with diagnosing the problem and ends with fixing it. If you follow this guide correctly, you will be able to improve your website's loading speed. If not, you might end up breaking your website.

1. Create a website traffic report To start this step, you need to analyze your website's page load speed using the online load time checker. Once you're done with that, you'll be able to discover if your website has any major issues.
2. Identify and eliminate bottlenecks After diagnosing the problem, you'll need to identify where your website is loading slowly. In this way, you can easily eliminate the bottleneck. For that, you can install the PageSpeed Insights tool on your website.
3. Optimize your images Once you've identified and eliminated the bottleneck, you'll need to optimize your images. If you don't do that, your website might load slowly even if your server is fast.
4. Upgrade your hosting services The last step is to upgrade your hosting services. Unless your hosting company offers you a good-quality package, it might not be able to serve your website for long.

A WSI (Web Site Inspector) is a special type of software which can inspect the quality of a website's HTML, CSS or XHTML page, in order to find the possible issues with web sites and their content. It runs in a small window on the user's computer and the results are displayed right away, so no cumbersome file upload process or lengthy processing time is required. What are the benefits of WSI? Although WSI is primarily a diagnostic tool for the maintenance of your site, you can use it to check the quality of any web page. WSI is a very simple tool which is easy to learn. It is highly advanced and efficient as it can handle all the different kinds of issues which may occur on your web pages. WSI is very easy to install and run. You can use

Introduction WMS Log Storage Professional Edition lets you visualize Media Services log files and export them to CSV format. It analyzes WMS log files and provides a wide range of statistics, including overviews, detailed info for each file, and a user report. It also allows you to export detailed statistics, such as count of hits, date ranges, files or file size to CSV format. This edition of WMS Log Storage also has many other features that will help you improve Media Services log analysis. For example, it automatically recognizes the formats for Media Services log files and processes multiple files at once. It can also export the results from Media Services to a CSV format.

Key features

- Analyzes Windows Media Services log files** The application can analyze Windows Media Services log files and export the results to CSV format. It recognizes many formats of Windows Media Services log files, including W3C. The application can also parse log files compressed with the ZIP, RAR, GZ, or TAR formats. This is especially useful for log files from dynamic web sites, such as Java Servlets. The application extracts information from log files and displays them in a simple table. You can access detailed info for each file, including the date, number of hits, unique IPs, referring websites and more. It can analyze file names and file sizes, and sort the results by date, name or size. Also, you can export the results from Media Services to CSV format, download an individual file or batch of files from a database, FTP, a web address or a local path on your PC.
- See what users did** You can use the application to see what Media Services users did on your website. It shows the number of visits, date ranges, referring sites and unique IPs. You can export this information to CSV format, as well as individual files and directory information from a database, FTP, a web address or a local path on your PC.
